# Periodic vs open boundary conditions (PBC vs OBC)

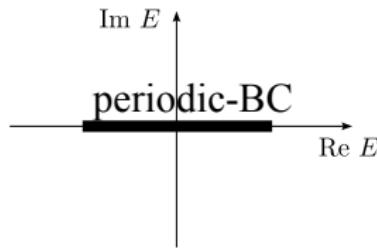

Model:

$$\varepsilon\psi_n = t(\psi_{n+1} + \psi_{n-1})$$

$$t = t^*$$

Energy spectrum:

$$E(k) = te^{ik} + te^{-ik} \quad \psi_n \propto e^{ikn} \text{ (periodic)}$$

# Periodic vs open boundary conditions (PBC vs OBC)

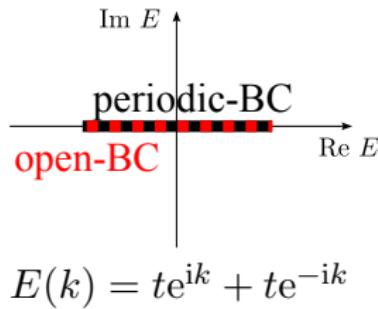

Model:

$$\varepsilon\psi_n = t(\psi_{n+1} + \psi_{n-1})$$

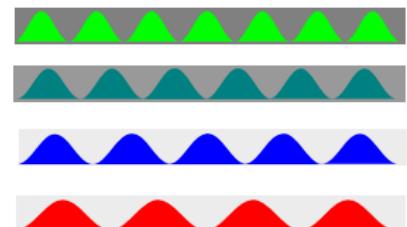

$$t = t^*$$

Energy spectrum:

$$E(k) = te^{ik} + te^{-ik}$$

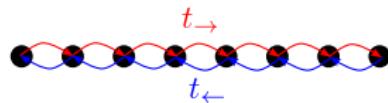

Eigenmodes:

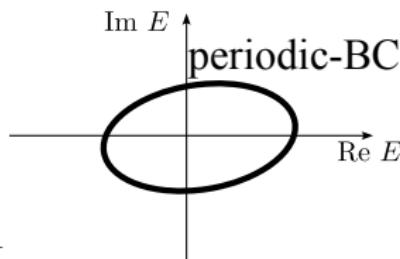

$$\begin{aligned}\psi_n &\propto e^{ikn} \text{ (periodic)} \\ \psi_n &\propto e^{ikn} + re^{-ikn} \text{ (open BC)}\end{aligned}$$

# PBC vs OBC in non-Hermitian structures

Model:

Energy spectrum:

$$\varepsilon \psi_n = t_{\leftarrow} \psi_{n+1} + t_{\rightarrow} \psi_{n-1}$$

N. Hatano and D. R. Nelson, PRB 56, 8651 (1997)

$$E(k) = t_{\leftarrow} e^{ik} + t_{\rightarrow} e^{-ik}$$

$$\psi_n \propto e^{ikn} \text{ (periodic)}$$

# PBC vs OBC in non-Hermitian structures

Model:

Energy spectrum:

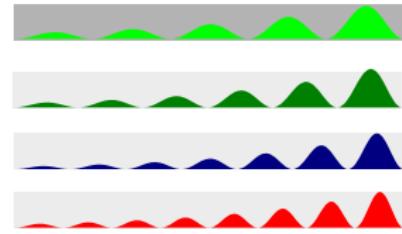

$$\varepsilon \psi_n = t_{\leftarrow} \psi_{n+1} + t_{\rightarrow} \psi_{n-1}$$

N. Hatano and D. R. Nelson, PRB 56, 8651 (1997)

$$E(k) = t_{\leftarrow} e^{ik} + t_{\rightarrow} e^{-ik}$$

Eigenmodes:

$$\begin{aligned}\psi_n &\propto e^{ikn} \text{ (periodic)} \\ \psi_n &\propto e^{ik_+ n} + r e^{ik_- n} \text{ (open BC)} \\ \text{Im } k_+ \text{ Im } k_- &> 0\end{aligned}$$

## non-Hermitian skin effect

- complex  $E(k)$  under PBC has non-zero winding number
- complex  $E$  under OBC collapses into a line
- OBC modes are concentrated at the edge

Mesoscopic NHSE

## Модель распространения экситонных поляритонов в структуре

$$x = \Gamma / \Gamma_0$$

$$P_{\text{exc}}(z) = \sum_{n=1}^N P_n a \delta(z - z_n) = \xi \sum_{n=1}^N \frac{\Gamma_0}{\omega_n - \omega - i\Gamma} \delta(z - z_n) E(z_n)$$

$$P_n = \frac{1}{a} \int dz P_{\text{exc}}(z)$$

$$\xi = \frac{\varepsilon_b}{2\pi k_b a}$$

$$(\omega_n - \omega - i\Gamma) P_n - i\Gamma_0 \sum_{n'=1}^N P_{n'} e^{ik_b |z_n - z_{n'}|} = \xi \Gamma_0 E_0(z_n)$$

## Уравнение для собственных частот в методе связанных осцилляторов

В этом методе собственные частоты находятся из уравнения

$$\det \| A_{lm} - \omega \delta_{lm} \| = 0,$$
$$A_{lm} = (\omega_0 - i\Gamma) \delta_{lm} - i\Gamma_0 e^{ik|l-m|}, \quad (11)$$

которое полностью эквивалентно уравнению (5). Так как след любой квадратной матрицы равен сумме ее

# What does “periodic non-Hermitian structure” mean?

Distributed loss:  $\text{rank Im } H \propto \text{size}$

Edge loss:

$\text{rank Im } H = \text{const}$ ,  $\text{rank Im } H / \text{rank Re } H \rightarrow 0$

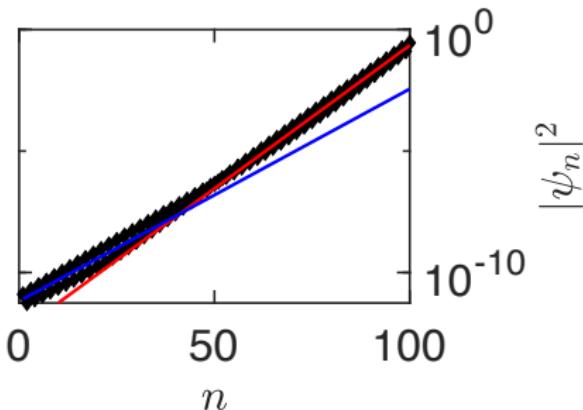

# Mesoscopic vs conventional NHSE

$$\psi_n \propto e^{iK_+ n} + r e^{iK_- n}, \quad n = 1 \dots N$$

Conventional:

$$\text{Im } K_+ \text{ Im } K_- > 0$$

$$K_+, K_- = \text{const}(N)$$

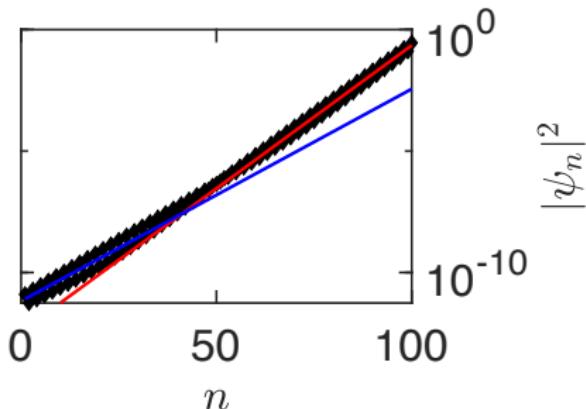

# Mesoscopic vs conventional NHSE

$$\psi_n \propto e^{iK_+n} + r e^{iK_-n}, \quad n = 1 \dots N$$

Conventional:

$$\text{Im } K_+ \text{ Im } K_- > 0$$

$$K_+, K_- = \text{const}(N)$$

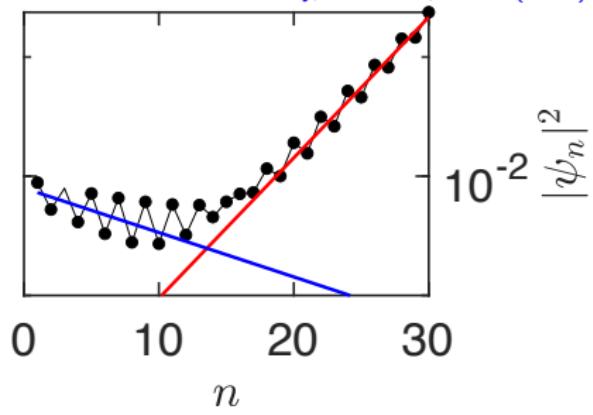

Mesoscopic:

$$\text{Im } K_+ \text{ Im } K_- < 0$$

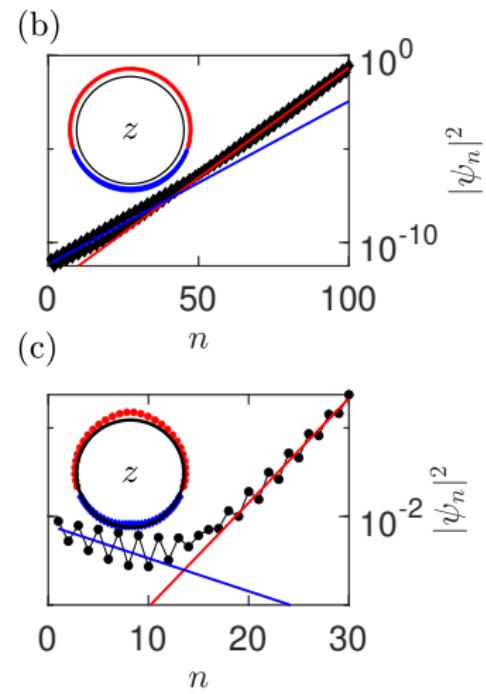

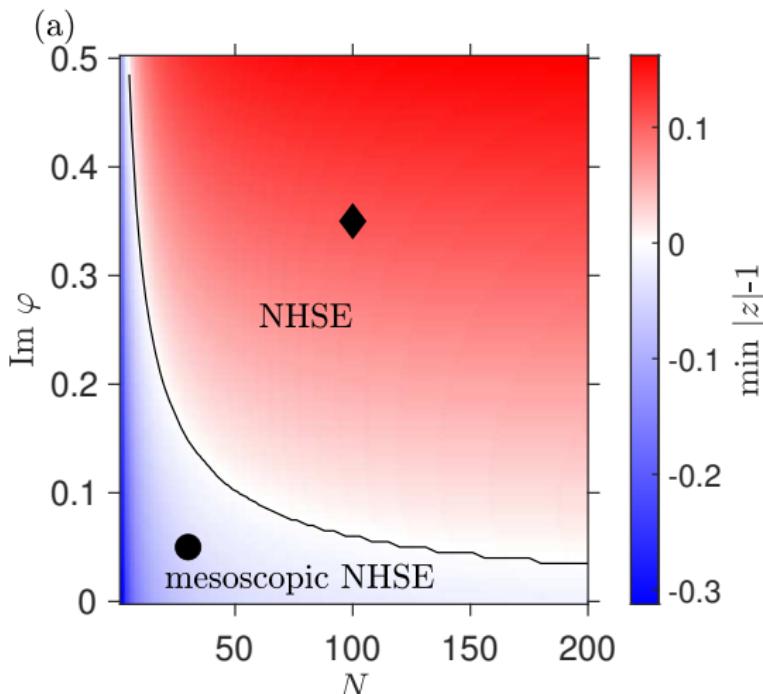

$$K_+(N), K_-(N),$$

$$|\psi_{N/2}|^2 / |\psi_1|^2 \propto 1/N$$

ANP and A.V. Poshakinskiy, PRA 108, 023707(2023)

# Transition to normal NHSE with losses

$$H_{mn} \propto e^{i\varphi|m-n|}$$

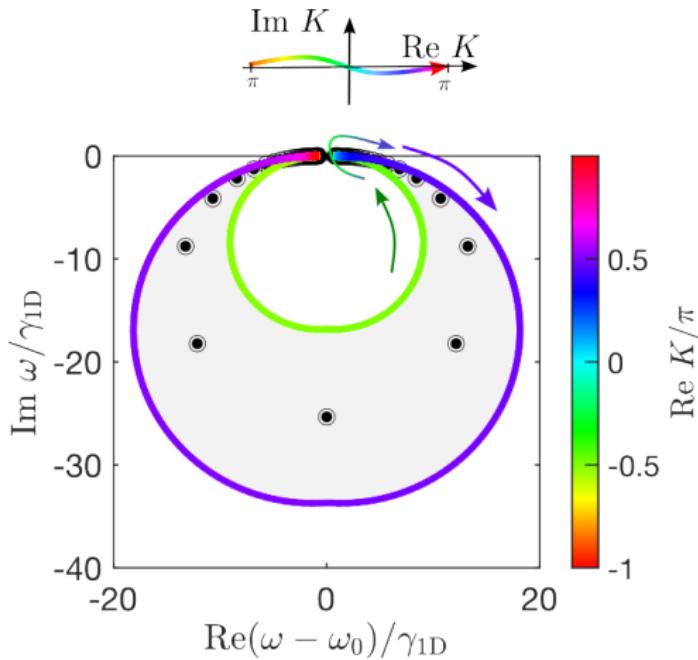

$$z_{\pm} = \exp(iK_{\pm}), \psi_m \propto z_+^m + r z_-^m, \quad m = 1 \dots N$$

# Regularized PBC spectrum and mesoscopic NHSE

$$k \rightarrow \text{Re } k - i\delta(N) \sin(\text{Re } k)$$

$$-\pi < \text{Re } k \leq \pi$$

$$\frac{\omega(k)}{\gamma_{1D}} = \frac{\sin \varphi + c \sin k}{\cos k - \cos \varphi},$$

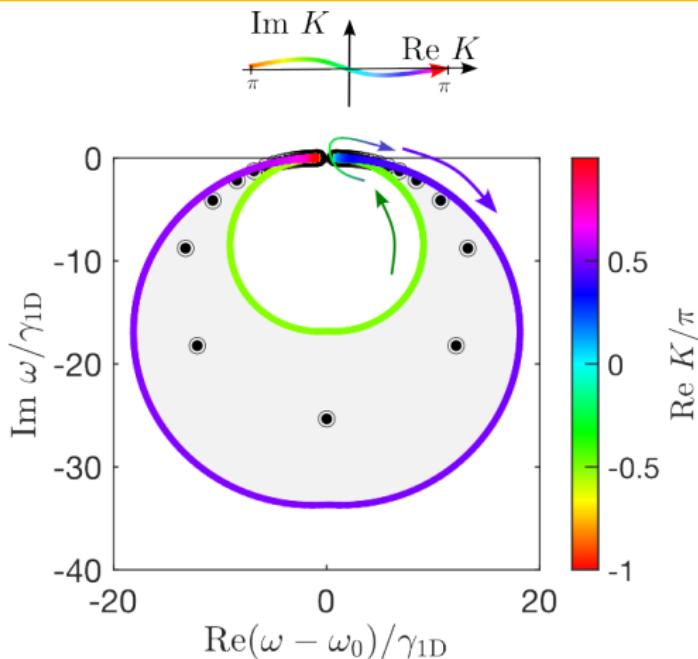

# Regularized PBC spectrum and mesoscopic NHSE

$$k \rightarrow \text{Re } k - i\delta(N) \sin(\text{Re } k)$$

$$-\pi < \text{Re } k \leq \pi$$

$$\frac{\omega(k)}{\gamma_{1D}} = \frac{\sin \varphi + c \sin k}{\cos k - \cos \varphi},$$

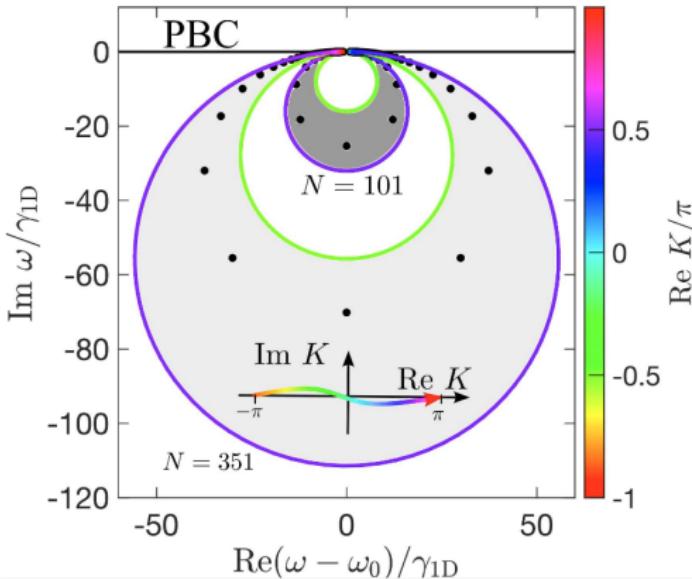

analytics for OBC:  $\omega_\nu^\pm = -\frac{iN\gamma_{1D}}{W_\nu \left( \pm 2N/\sqrt{1-c^2} \right)}, \quad \nu = 0, \pm 1, \pm 2 \dots$

# Regularized PBC spectrum and mesoscopic NHSE

$$k \rightarrow \operatorname{Re} k - i\delta(N) \sin(\operatorname{Re} k)$$

$$-\pi < \operatorname{Re} k \leq \pi$$

$$\frac{\omega(k)}{\gamma_{1D}} = \frac{\sin \varphi + c \sin k}{\cos k - \cos \varphi},$$

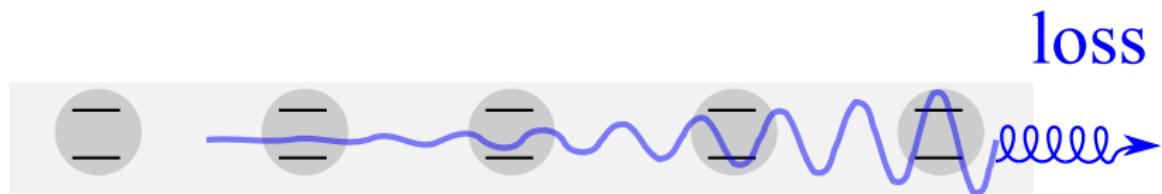

analytics for OBC:  $\omega_\nu^\pm = -\frac{iN\gamma_{1D}}{W_\nu \left( \pm 2N/\sqrt{1-c^2} \right)}, \quad \nu = 0, \pm 1, \pm 2 \dots$

analytics for  $c = 0$ : [A.V. Poschakinskiy and ANP](#), PRA 108, 023707 (2023)

## Summary: mesoscopic NHSE

- The concept of NHSE potentially applies also to finite-size photonic structures with neither gain nor loss in the bulk and purely real energy spectrum under periodic boundary conditions (PBC)
- regularized size-dependent PBC spectrum
- definition of non-Hermitian periodic system requires clarification

arXiv:2310.04025v1

## Some equations

Dispersion law:  $w(K) = \frac{\sin \varphi + \chi \sin K}{\cos K - \cos \varphi}$ , where  $\chi = \frac{1 - \xi}{1 + \xi}$ .

Eq. for spectrum:  $r_{\leftrightarrow}(\omega)r_{\leftarrow}(\omega)e^{i(K_+ - K_-)(N-1)} = 1, r_{\rightleftarrows} = -\frac{e^{\pm iK_{\pm}} - e^{i\varphi}}{e^{\pm iK_{\mp}} - e^{i\varphi}}$

Eigenstates:  $\psi_m \propto e^{iK_+(m-N)} + r_{\leftarrow} e^{iK_-(m-N)} \propto e^{iK_+(m-1)} r_{\leftrightarrow} + e^{iK_-(m-1)}$ ,

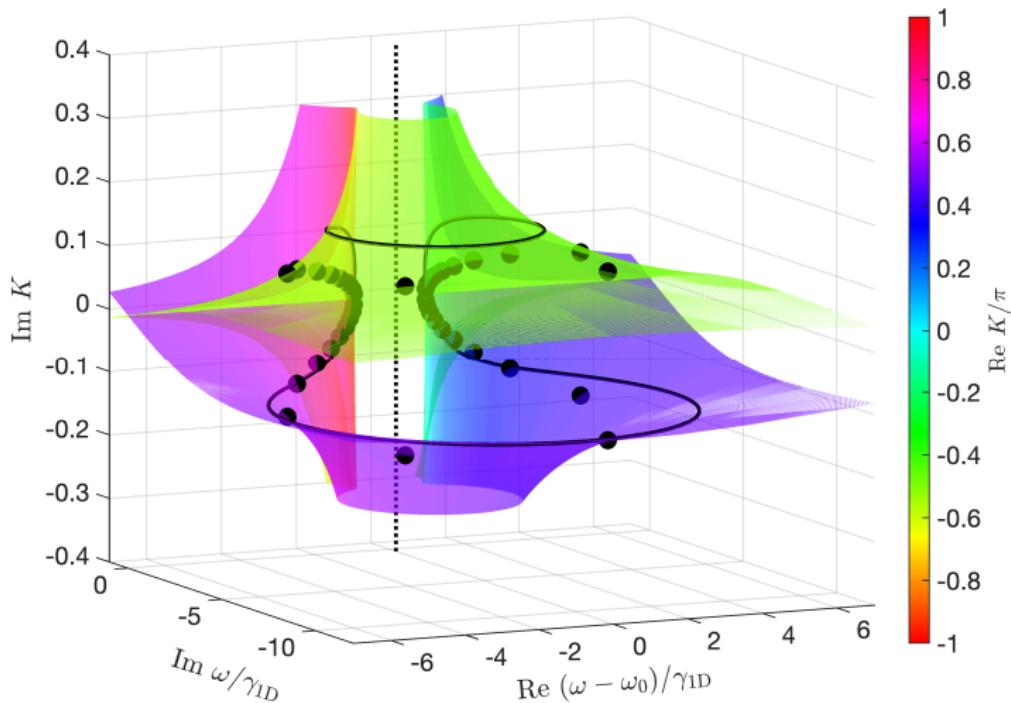

$$K_{\pm} \approx \pm \frac{\pi}{2} + (\chi \mp 1) \frac{\gamma_{1D}}{\omega - \omega_0}.$$

$$r_{\leftrightarrow} \approx -\frac{i(\chi + 1)}{2\omega}, \quad r_{\leftarrow} \approx -\frac{i(1 - \chi)}{2\omega}, \quad r_{\leftarrow} r_{\leftrightarrow} e^{i(K_+ - K_-)} \approx \frac{1 - \chi^2}{4w^2}.$$

$$\frac{1 - \chi^2}{4w^2} e^{-\frac{2iN}{w}} + 1 = 0.$$

Spectrum:  $\omega_{\nu}^{\pm} - \omega_0 = -\frac{iN\gamma_{1D}}{W_{\nu} \left( \pm 2N/\sqrt{1 - \chi^2} \right)}, \quad \nu = 0, \pm 1, \dots$

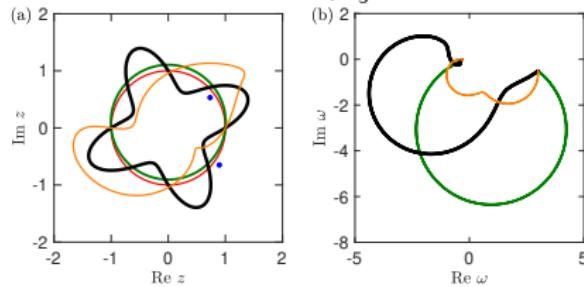

# Riemann surface of $\omega(k)$

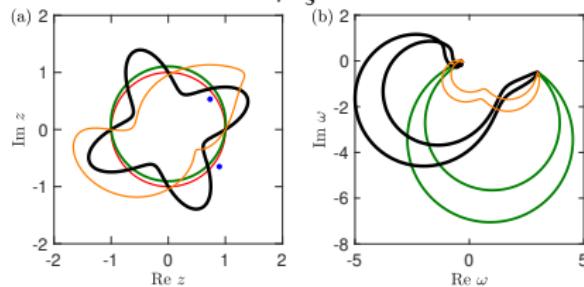

# More topological arguments

$$w(K) = \frac{\sin \varphi + \chi \sin K}{\cos K - \cos \varphi}, \quad z = e^{iK}$$

Non-chiral,  $\xi = 0$

Chiral,  $\xi = 0.8$

## Loss/chirality phase diagram

$$H_{m,n} = -i \begin{cases} \gamma_{\rightarrow} e^{i\varphi|m-n|}, & m > n \\ \frac{\gamma_{\rightarrow} + \gamma_{\leftarrow}}{2}, & m = n \\ \gamma_{\leftarrow} e^{i\varphi|m-n|}, & m < n \end{cases}$$

$$H_{nm} - H_{mn}^* = -i\gamma_{\rightarrow} e^{i\varphi(n-m)} - i\gamma_{\leftarrow} e^{i\varphi(m-n)}$$

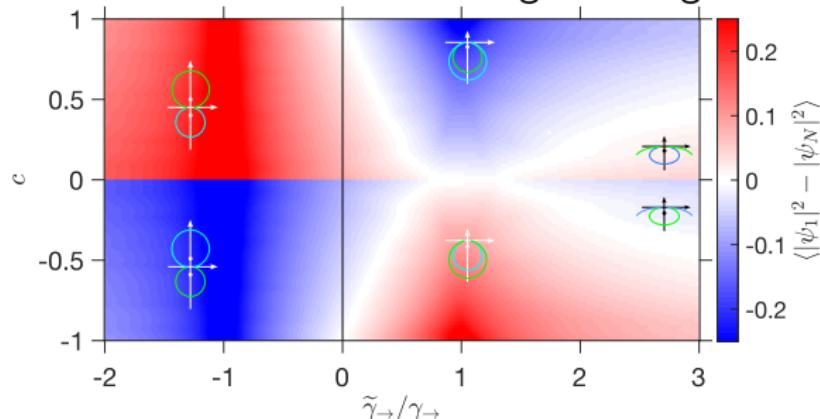

$$H_{nm} - H_{mn}^* = -i\tilde{\gamma}_{\rightarrow} e^{i\varphi(n-m)} - i\gamma_{\leftarrow} e^{i\varphi(m-n)}$$

# Loss/chirality phase diagram

$$H_{m,n} = -i \begin{cases} \gamma_{\rightarrow} e^{i\varphi|m-n|}, & m > n \\ \frac{\gamma_{\rightarrow} + \gamma_{\leftarrow}}{2}, & m = n \\ \gamma_{\leftarrow} e^{i\varphi|m-n|}, & m < n \end{cases}$$

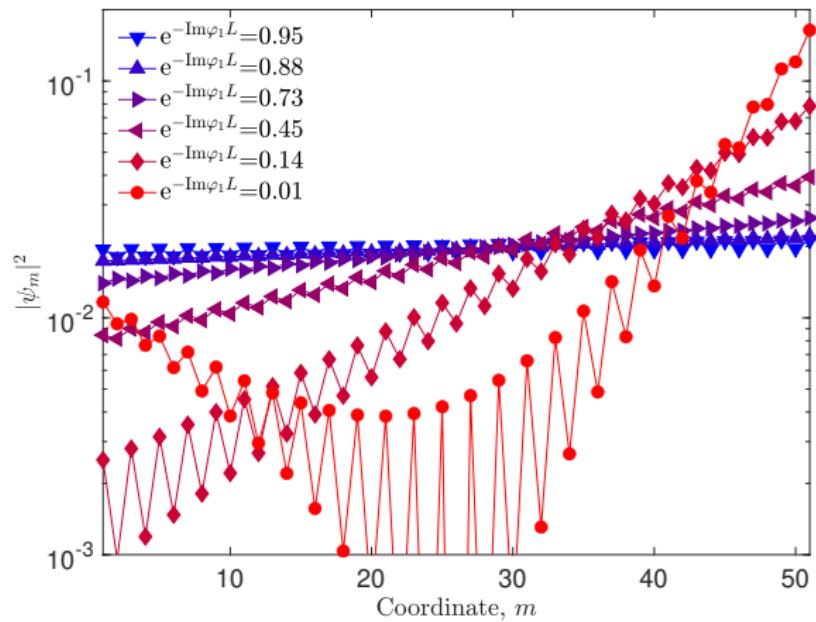

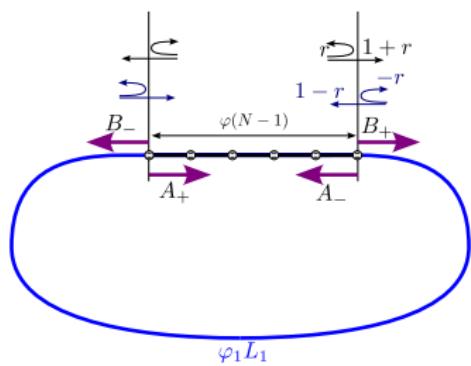

$$H_{nm} - H_{mn}^* = -i\tilde{\gamma}_{\rightarrow} e^{i\varphi(n-m)} - i\gamma_{\leftarrow} e^{i\varphi(m-n)}$$

Let us tune losses through the edges.

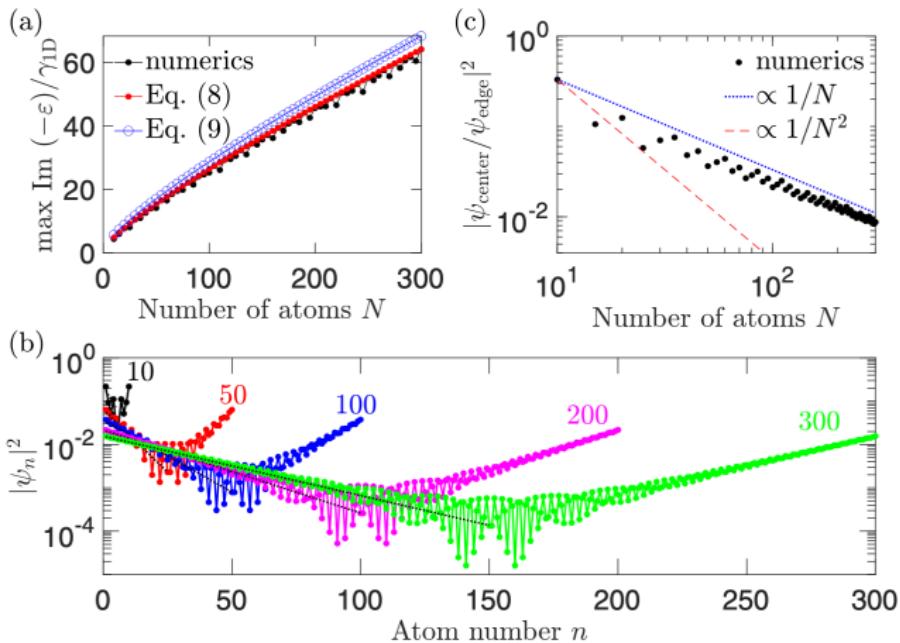

Tight binding analogy: [W.-T. Xue, Y.-M. Hu, F. Song, and Z. Wang, "Non-Hermitian Edge Burst," PRL 128 120401\(2022\)](#)

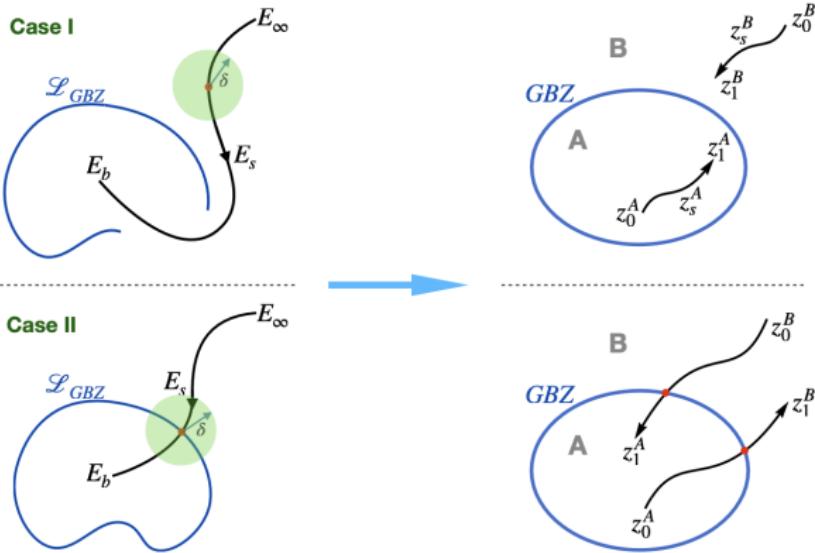

# Circular waveguide
